Finite Element Method Using Matlab

Finite element analysis (FEA) is a computational method for predicting how structures behave under loading, vibration, heat, and other physical effects. This technique allows entire designs to be constructed, evaluated, refined, and optimized before being manufactured. Finite element analysis provides numerical solutions to boundary value problems that model real-world physics as partial differential equations.

Finite Difference Method for PDE using MATLAB (m-file) Author Mathematics, MATLAB PROGRAMS In mathematics, finite-difference methods (FDM) are numerical methods for solving differential equations by approximating them with difference equations, in which finite differences approximate the derivatives. FDMs are thus discretization methods.
